Business Operations Mobile App

BUSINESS SITUATION

- B2B clients need to eliminate disparate, poorly connected travel and financial systems in order to reduce costs, decrease errors, and improve speed of functions
- Using unified systems for reporting and approving expenses via a single source for all employees also would drive compliance, and provide real-time analytics.

FRAMEWORK

- We identified all the components to incorporate, e.g., vendors for flights, trains, hotels, taxis, food, & beverage, as well as which stakeholders need to receive which data.
- Numerous APIs were built to automatically connect systems from multiple companies to permit real-time processes including geotagged validation systems.

RESULTS

- The mobile app allows companies to unify travel bookings across the entire company, simplifying systems and processes, and reducing both timelines and errors.
- It also helps companies understand where and when costs are occurring in order to identify areas of concern, whether positive or negative.
